Iteration 2 Retrospective

What went well?

1. Time tracking is clear and provides insightful reports regarding the time spent by each team member
2. Most of the user stories match the INVEST criteria (with a few exceptions to be discussed later)
3. The client is satisfied with our progress so far
4. Multiple branches in our git
5. Git is much more organized for the merging after we assigned a Product QA
6. Frequent and small commits.

What could have been done better?

1. We were doing ad hoc in some areas when documenting tasks for user stories, a more agile approach would be better.
2. The user story as commits messages drown out the actual git commit message.
3. The landing page should not have a subscription offer as the application is currently free.

What will we try next?

1. We'll switch to Clockify instead of Toggl for time tracking as Toggl free trial will have finished.
2. The GIT commits messages to be used as the title and the user story as the description.
3. Time tracking should be able to sort by user stories
4. The user story for the dashboard (14.2) should be broken down. Each widget should have its own user stories.
5. Have detailed and clearly defined processes in our backlog, the definition of done needs to be more detailed and specific.
6. Tasks in the user stories need to be allocated to each member separately (avoid ad hoc).
7. The landing page subscription plan should be changed to RM0.

What questions do we have?

1. Are there any alternatives to Toggl time tracking besides Clockify?
2. Do non-functional user stories need to have story points?
3. How can we enhance the confidentiality and integrity of user information/this application?
